

JMP.chat – Phone Provider

<https://jmp.chat/>

Dino.im – XMPP Client, (Messaging Focused)

<https://dino.im/>

Gajim – XMPP Client, (Desktop Focused)

<https://gajim.org/>

LinPhone – SIP Softphone App

<https://www.linphone.org/en/>

JMP.chat gives you a real NANP phone number (US/Canada), full SMS and calls, and everything routes through packages with native Linux clients. It's about \$3-4/month and you don't need any Google account at all.

You'd just need:

- A **JMP.chat** account (sign up with just an email)
- One of these apps on Debian:
 - **Dino** or **Gajim** – XMPP clients that connect directly to **JMP.chat** over XMPP for calls and texts
 - **Linphone** – a SIP softphone that connects to **JMP.chat** (which also offers SIP support) for a traditional dialer experience
- Done — texts and calls work natively through whichever app you choose

All three apps give you the same phone service from **JMP.chat**; just pick the interface you like best.
